

SOMSO
MODELLE
SINCE 1876

5/2

THE FEMALE ORGAN

ANGELIKA BECK

THE MODEL IS SUPPLIED WITH A DETAILED DESCRIPTION AND CD

(The CD is currently only available in German. The English version is in preparation.)

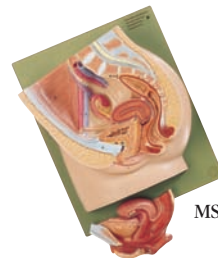

- Overhead transparencies (coloured and with a key)
- PowerPoint presentation
- Reproducible diagrams for painting and annotating

WHEN COMBINED, THE MODEL AND DIAGRAMS CLEARLY DEMONSTRATE THE COMPLEX ANATOMY OF THE FEMALE ERECTILE BODY

- Notes on the value of this model for sex education
- Notes for using the model in lectures and lessons
- Pelvic Floor Muscle Exercises in two versions – Adult and Child

Further models on this topic can be found in our Anatomy Catalogue A74/I or on our website www.somso.de

SINCE 1876

MS

MODEL OF SEXUAL

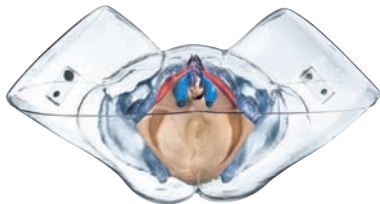

ACCORDING TO

This model has been developed to promote the knowledge of female anatomy gained in light of current research.

This model has been produced in co-operation with biologists, sex educationalists, sex therapists, sexual researchers, gynaecologists and urologists.

top-view of the model, closed

model from below

The model is designed to be handled. It can also be opened to show the inner organs including the location of the bladder, vagina and the large intestine. The size of clitoris is clearly visible as are the hollow chambers which fill with blood and swell during arousal - in the same way as the male erection.

SOMSO
MODELLE
SINCE 1876

MS 5/2 MODEL OF THE FEMALE SEXUAL ORGAN

This model, based on current research, offers a new perspective on both female sexuality and sexual relationships
This life size model is made of SOMSO plast and was developed in co-operation with Oberstudienrätin Angelika Beck. Height 23cm, Width 49cm, Weight 2.5 kg.

Individual organs are colour coded for easy identification

- Green:
Ovaries, fallopian tubes, uterus and vagina
- Yellow, orange and dark pink:
Bladder, urethra, female prostate and clitoris
- Blue:
Bulbi vestibuli - capillary tissue which swells during arousal
- Pale pink:
Intestine and pelvic floor

The outdated picture of the lack of a penis and minute clitoris in a woman is now replaced by the detection of similarities in the structure of female and male genitalia as a result of embryological studies.

In preparation the model of the male sexual organs MS 3/2.
Date February 2006.
